

Sample Test Cases for Project 3

A few people have asked about what test cases they can expect to be run against their code. The below bulleted items give an *approximate* idea of how I will test your code.

Basics

1. execute "help" for instructions
2. execute "list" without running any jobs or tests and check output
3. change policy to "fcfs" with no jobs in queue
4. change policy to "sjf" with no jobs in queue
5. change policy to "priority" with no jobs in queue
6. execute "quit" without running any jobs or tests
7. execute "foo" command to check for error handling

"run" command

1. run short job with FCFS policy, check output with list, repeat 2-3x, quit
2. run short job with SJF policy, check output with list, repeat 2-3x, quit
3. run short job with Priority policy, check output with list, repeat 2-3x, quit
4. run 2-3 long jobs with Priority policy, check output with list, quit
5. run 2-3 long jobs with FCFS policy, check output with list, quit
6. run 2-3 long jobs with SJF policy, check output with list, quit
7. run 5 long jobs with arbitrary policy, change to Priority policy, check for re-scheduling
8. run 5 long jobs with arbitrary policy, change to FCFS policy, check for re-scheduling
9. run 5 long jobs with arbitrary policy, change to SJF policy, check for re-scheduling

"test" command

1. run "test" for each policy with 1, 2, or, 3 parameter sets, then quit to check metrics. Each test will be contain 10 to 20 jobs and all parameters will be selected to be valid positive numbers. I will use "list" to check the execution status of the jobs.
